Output Webpage 100% Zoom Default page (When link is opened, meditations component is shown)

Tao Te Ching component

Title changes based on active component

The screenshot shows a code editor with four files open:

- app.component.html**: Contains an component and a that activates the "meditations" route when the "onRouteActivate" event is triggered.
- header.component.html**: A header template with a title and a navigation menu. It uses routerLinkActive="active" to style the active navigation item.
- app.component.ts**: An Angular component that sets the template URL to "app.component.html", makes the "AppComponent" standalone, and provides a style URL. It also contains logic to set the title based on the active component via the "onRouteActivate" event.
- header.component.ts**: An Angular component for the header. It imports { Component, Input } from '@angular/core'. It has a @Component decorator with selector: 'app-header', standalone: false, templateURL: './header-component.html', and styleURL: './header-component.css'. It also exports a HeaderComponent class with an @Input() Title: string = '' and a Date = new Date().getFullYear(); property.
